Date	23/2/22		

**Date:** 1-10-21

**Patient:** Champagne Walk 20

**Owner:** Haunui Farm LP

**Diagnosis:** Right hind fetlock sagittal ridge fragment

### Surgery

The horse was placed in dorsal recumbency under general anesthesia on 30-9-21. The right hind fetlock was operated via dorsomedial and dorsolateral portals. The sagittal ridge fragment measured approximately 15mm by 10mm. It was removed with ronguers from the proximal joint. The bed of the fragment was healthy bone with some cartilage regrowth present. The joint appeared healthy with no score lines.

The incisions were closed with 0 Ethilon and bandages were applied.

The horse recovered without event.

### Dorsal fragment before and after removal

### Healthy condyles

### Treatments

The horse received intravenous and intramuscular antibiotics for 24 hours while at the hospital. The bandages were changed 2 days following surgery and the sutures appeared normal.

### **Treatments at home**

**Phenylbutasone-** Give 1 syringe by mouth daily beginning the day following dismissal from the hospital. Give for 3 days.

**Bandages-** The bandage will need to be changed every 4-5 days until the sutures are removed. This horse kicks during bandage changes and should be sedated heavily.

**Sutures-** The sutures should be removed in 2 weeks.

### **Rehabilitation**

The horse will need 3 weeks in a box. After the sutures are removed allow turn out for 1 week in a small pen (no larger than 20m by 20m). After 3 weeks post-op, allow normal turn out.

### **Prognosis**

**Excellent.**

**If you have any questions or concerns, please call us at the clinic, 09 294 7307.**

Lacy Kamm DVM, MS, DACVS
