

Pregnancy Certificate

Mare: Prospect

Colour: Bay

Brands: T through Y / 33 over 1

I have examined the above identified mare at Highden Park, Palmerston North, via rectal palpation and ultrasound examination, as requested by Libby Bleakley on 15.11.22.

The mare was in foal at the time of the examination, consistent last date of service 09.09.22. A foetal heartbeat was detected.

Foetal sex testing was carried out. The foetus appeared most likely to be a colt.

A handwritten signature in black ink, appearing to read 'Lucy Russell', written in a cursive style.

Lucy Russell BVSc, Cert AVP, PG Cert VPS (dist.)

Date: 23.04.23

Disclaimer: while every precaution is taken to identify multiple pregnancies at every examination undertaken, there is a small risk that a twin may be missed, even by the most experienced of veterinarians. The risk of early embryonic death in mares is greatest before 42 days of gestation, but foetal loss may occur after this time. Foetal sexing can not be guaranteed to be 100% accurate, all efforts are made to provide the most accurate result possible at the time of examination.
